Highlights

- Under full AGI substitution, market employment falls monotonically to zero.
- A high market-employment endpoint is unreachable and read as a counterfactual.
- Full public-employment absorption gives two basins: crash or smooth transition.
- The critical frontier growth is 0.095 at tau=0.15, saturating near 0.14.
- On the smooth path, minimum consumption is 0.407 and residual unemployment is zero.
